└── yolo_models *YOLO目标检测模型*
```

环境配置步骤

ROS依赖配置

```
conda deactivate
pip install -i https://mirrors.tuna.tsinghua.edu.cn/pypi/web/simple scipy opencv-
python
```

YOLOv12环境配置

首先使用 `nvcc -V` 查看本机cuda版本（11或12） 接着依次运行下面的命令

```
cd ~/
git clone https://github.com/sunsmarterjie/yolov12.git
cd yolov12
conda create -n yolov12 python=3.11
conda activate yolov12
pip config set global.index-url
https://mirrors.tuna.tsinghua.edu.cn/pypi/web/simple
wget https://github.com/Dao-AILab/flash-
attention/releases/download/v2.7.3/flash_attn-2.7.3+cu11torch2.2cxx11abiFALSE-
cp311-cp311-linux_x86_64.whl
```

```
#  若cuda版本为12则将链接替换为 https://github.com/Dao-AILab/flash-
attention/releases/download/v2.7.3/flash_attn-2.7.3+cu12torch2.2cxx11abiFALSE-
cp311-cp311-linux_x86_64.whl 同时修改requirements.txt中的文件名
pip install -r requirements.txt
pip install -e .
```

系统启动步骤

将comsen_challengecup目录放至主目录下,接着分别在三个终端中依次运行下列命令

```
cd ~/comsen_challengecup
chmod +x ./start_competition.sh
conda deactivate
./start_competition.sh
```

等待上述命令输出启动成功的标志后再执行接下来的命令

```
cd ~/comsen_challengecup
chmod +x ./start_yolo12.sh
conda activate yolov12
./start_yolo12.sh
```

```
cd ~/comsen_challengecup/workspace
catkin build && source devel/setup.bash
roslaunch main.launch
```

本项目已在https://github.com/ArceusChris/comsen_challengecup开源
